1. Introduction - Business Context

Stationaries and Office Supplies Inc. (SAOS) are expanding and there is an urgent need to re-engineer their business operations. Given its manual way of handling business, the expansion of its customer base (clients have increased from 5 to 18), and increase in range of product supplies (the range of products has been enlarged from 178 to 316 items) have developed a bottleneck in its operating system and has led to dissatisfaction, operational deficiencies and conflict – delivery delays, invoicing errors, over-invoicing, stress, work overload, inappropriate attitude, etc. Initially, SAOS handled five clients and was using a manual process to receive and register orders, generate and validate invoices as well as to deliver products (order fulfilment). The operational re-engineering and Salesforce CRM implementation will optimize SAOS business processes, boost efficiency, meet customer needs, increase profitability, and reduce employee workload. An As-It-State process improvement diagram (Figure 1 below) is as follows

Problem Analysis (As-It-State)

Stationaries and Office Supplies Inc, (SAOS) had tie-ups with five clients, numbered 001 through 005, in the same multi-storied building. The company uses computers only for mails and basic documentation (by the manager). Whenever any client needs any office supplies, somebody from their office calls and asks for them. An entry is made in the order- received register by the shop order clerk. He sends an order slip to the delivery clerk. Once the supplies are packed, an entry is made in a delivery register by the delivery clerk and the supplies are sent to the clients through the shop courier. At the end of every day, an order received report is prepared by the office clerk for every client. Also, at the end of every day, a fulfilment report is generated by the delivery clerk for every client. Both the reports are given to the manager. The manager checks both the reports for the correct item, quantity and value. The manager creates an invoice for each client, and emails verified invoices to respective clients the next day in the morning.

2. Project Objective

The objective is to implement salesforce CMS to automate the business functions of stationaries and office supplies Inc. (SAOS). The old manual tasks will be completed by using digital tools for logging orders, following when they are delivered, issuing invoices, accounting and checking reporting and analyzing data. With an Agile method, the project will launch features in small steps, based on order of importance for users to help workflow, minimize mistakes, make customers happier, and allow the business to grow.

3. Implementation of the Commercial Off-The-Shelf (COTS) Solution - Salesforce CRM Software – Proposed Solution through Market Research and Analysis

To enhance operational efficiency, process effectiveness, and eliminate bottlenecks, SAOS is undertaking the computerization of its order logging, order fulfilment, customer invoicing, accounting and reconciliation, report generation, and data analysis processes. The project team has recommended Salesforce and the adoption of an Agile framework for digital transformation as a highly effective solution.

4. An Executive Summary of Salesforce CRM Software

Salesforce CRM is an advanced cloud-based system which enables a company to manage its relationships with customers and potential customers in all areas. In simple terms, it is the main place where customer data is stored and organized, such as information, history of interactions, and communication preferences. This allows not only teams in sales, marketing, customer service, and commerce but also any worker to have the latest information from any place. The software tool is a great help to businesses in automating their operations, increasing their efficiency, and building stronger relationships with their customers by keeping track of every customer interaction, handling sales opportunities, and gaining insights for action.

As a project team, our proposal for the implementation of the Salesforce CRM and the use of an agile development approach in solving the operational deficiency is influenced by our extensive market research and analysis, and the expectations of our stakeholders in their ability to log and fulfil orders, generate customer invoicing, perform accounting and reconciliation, report generation and to track order and fulfilment data analytically.

5. Salesforce CRM Software: End-User Expectations and Functions

Through market research and extensive consultation with Salesforce representatives, we have learnt that the salesforce software can perform all the expected functions SAOS would like to experience in their operational transformations.

With respect to **Order Logging**, customers will be able to submit orders through various channels – online, mobile, in-store etc. The software can capture and log all order details in a centralized system. When

integrated with Order Management, it can transform and store order data, match customer profiles, and create order summaries for ongoing management. This will help solve the problem of order mismatches and errors.

Concerning **Order Fulfilment**, orders will be transferred to the right fulfillment centers based on inventory, location, and business rules. The Salesforce Order Management will automate and orchestrate fulfillment by assigning orders to the appropriate location, updating inventory, and coordinating with fulfillment partners like the delivery clerk. This can reduce the problem of manual order and delivery registrations.

Regarding **Customer Invoicing**, the software will generate an invoice based on input data and send it to the customer after order fulfillment. Salesforce can trigger the creation of invoices and interface with payment providers to ensure funds are collected. This will reduce the manual work of the shop clerk and manager in invoice creation and verification.

With **Accounting and Reconciliation**, financial transactions can be recorded, reconciled and reported. While Salesforce CRM and Order Management handle order and payment data, the software's accounting solution (via AppExchange) can be integrated for full accounting and reconciliation. This ensures payments, sales, and invoices are accurately reflected in SAOS books.

6. Process Re-engineering with the adoption of the Salesforce CRM software

Figure 2 - Proposed process flow with the adoption of the Salesforce CRM software

Source: Author Construct using Lucid Chart (2025)

For **Report Generation**, Salesforce has an in-built reporting and dashboard tool. This function can help generate reports on orders, fulfillment status, invoices, payments, and more. Custom reports can be created to meet specific business needs. This will help the manager to track sales, identify shortcomings and recommend suggestions for operational improvements.

Finally, for data analytics, Salesforce provides also an analytic tool of high quality, for instance, tableau CRM, that enable users to explore the behavior of orders, customers' purchasing decisions, the efficiency of fulfilling and financial figures. These observations are sources that assist in the optimization of the operation of the customer and the improvement of the experience of the customer.

Following extensive research on the choice of COTS Solution software, the project employs an agile development approach as a practical step in eliciting stakeholder requirements in its solution development. The process will include user story elicitation, iteration, sprint backlog, backlog grooming and refinement, reviews and sprint retrospective. The practical solution steps follow next.

Product Integration and Configuration - The Agile Development Approach

7. User stories

User stories describe desired functionality from a user's perspective. To meet the needs of key stakeholders, clients, shop clerks, delivery staff, auditors, the manager and the CEO—user stories have been elicited from the users. These stories will help the project team know what to develop to give value right away.

The narratives were created using the standardized PMI template.

*As a **User**, I want **capability** so that I get **business value or functionality***

Every user story is tied to an acceptance criterion, and this will help the project team to know when a story is complete.

User ID	Description / Intent	Feature	Acceptance criteria
SAOS001	As a shop order clerk, I want to make sure all client orders are entered into a computer to decrease opportunities for human errors.	Order Logging: Digital order entry	1. Users have the option to choose both a client and an item during selection. 2. The software permits adding input for the quantity of items. 3. Your order has been saved and can be found in your system.
SAOS002	I want to update delivery status and track my duties online as a delivery clerk so no one can question our transparency.	Order Fulfillment: Digital tracking	1. Order status can be changed through the tool. 2. It is possible to enter the details of how a product ought to be sent. 3. You can notice fulfillment within the system.
SAOS003	Being a manager, I strive to have invoices sent and generated instantly, so we can stay accurate and work on time.	Customer Invoicing: Automated invoicing	1. Every order receives an invoice. 2. An invoice should show only accurate items, quantities and prices. 3. You can email invoices to your clients.
SAOS004	My job as an accountant is to verify orders and payments	Accounting and Reconciliation	1. An order always comes with payment.

	to prevent gaps between them.		2. Where there are irregularities, these are noted.
SAOS005	As a manager, I want to keep track of business performance with the help of daily and monthly reports I produce.	Report Generation: Automated reporting	1. Generate reports that cover daily and monthly periods. 2. Orders fulfilled items and payments are all part of the data found in reports. 3. Organizer allows you to export your reports.
SAOS006	I wish to review order and fulfillment data as a manager to find trends and organize operations better.	Data Analysis: Data analytics	1. Users can make use of data visualization on the website. 2. You can use filters to group trends by date, by client company or by item. 3. Analysis results are able to be saved outside of the application.

G. Project Backlog

Project Backlog was built by making user stories into technical and functional actions that the team would complete. Every item is ranked by how much it affects the company's activities and user satisfaction.

Complexity and effort are estimated with **story points**, using relative comparison. At the start, the team works on digitizing order intake and automating invoicing since they are considered important.

Throughout the project, refinement sessions will keep evolving the backlog so that the most valued features are developed first and input from the team is captured all the time.

10. Product Backlog

User ID	Description (Intent)	Feature	Priority Status	Story Point and Estimates	Owner	Business Value and Criticality	Dependencies	Risk	Current Status
SAOS001	As a shop order clerk, I want to make sure all client orders are entered into a computer to decrease opportunities for human errors.	Order Logging: Digital order entry	HIGH	S / 2	Jeffery	10	None	Low	Finished
SAOS002	I want to update delivery status and track my duties online as a delivery clerk, so no one can question our transparency.	Order Fulfillment: Digital tracking	HIGH	M / 3	Samarth	9	SAOS001	Low	Finished
SAOS003	As a manager, I strive to have invoices sent and generated instantly, so we can stay accurate	Customer Invoicing: Automated invoicing	HIGH	L / 5	Eduardo	8	SAOS001, SAOS002	Medium	Finished

	and work on time.								
SAOS004	As an accountant, I want to verify orders and payments to prevent gaps between them.	Accounting and Reconciliation	MEDIUM	M / 3	Priyanka	7	SAOS001, SAOS002, SAOS003	Medium	Finished
SAOS005	As a manager, I want to keep track of business performance with the help of daily and monthly reports I produce.	Report Generation: Automated reporting	MEDIUM	S / 2	Musab	6	SAOS001, SAOS002, SAOS003, SAOS004	Low	Finished
SAOS006	As a manager, I want to analyze order and fulfil data so that I can identify trends and improve operations	Data Analysis: Data analytics	LOW	M / 3	Nidhi	5	SAOS001, SAOS002, SAOS003, SAOS004, SAOS005	Medium	Finished

11. Release Plan

The Agile project follows the principle of delivery in iterations. Thus, the solution is being delivered in small and functional modules rather than one large implementation. In case of a single large implementation, it will help to get the same problems that are faced in the early stage of the project.

Through this the value is delivered quickly and frequently, and the existing issues are identified and resolved in a short time.

The team performs three activities at the end of each sprint:

- User Acceptance Testing (UAT): In a real-world environment the features are used by the clients and then the clients are told if they meet the acceptance criteria and business needs. Any faults, usability issues, or missing functionality are described.
- Sprint Review & Demo: Stakeholders, like the CEO and department heads, are the target audience to whom the team gives an overview of the completed work. The feedback is collected from them directly.
- Backlog Refinement: The improvement is planned, prioritized, and agreed upon, using up to four weeks' time for the refinement of one product backlog item or one sprint.

This utterance delivery, implementation checks with the users, and feedback from the users are the inputs used in ensuring:

- Client and stakeholder expectations are met
- Features are relevant, tested, and usable
- The product changes are guided by real business challenges and needs

The system is being worked on little by little, right from the beginning, and the defect identification, usability tests, and enhancement have been carried out from time to time since the previous release. Therefore, the system has been very low at risk of abandonment by the time of reaching the final stage of being rolled out.

Release 1: Client Ordering Digital Transition

Objective: Make the main manual steps electronic placing an order, monitoring the order, and delivery.

Sprint	Release Cadence	User story delivered	Sprint delivered	Output
Sprint -1	Week 2 by the end of Sprint 2	SAOS001	Clerk able enter order digitally	The whole order process gets automation in full extent. Shop clerks enter order data
Sprint -2		SAOS002	Delivery tracking integration activated	

				electronically, and delivery clerks update status in real-time. Thus, manual calls are not necessary anymore.
--	--	--	--	---

Release 2: Digital Invoicing & Audit Trail

Objective: Introduce automation in the generation of reports and invoices to decrease the burden on managers from the billing process.

Sprint	Release Cadence	User story delivered	Sprint delivered	Output
Sprint -3	Week 8 by the End of Sprint 4	SAOS003	Invoices generated and verified automatically with unique Invoice id's	Invoices are assigned with unique IDs. Log and invoice records are precise, protected, and help reduce the manager's work.
Sprint -4		SAOS004	logs and invoices can be obtained and used for checking but these are safe by the established protocol	

Release 3: Client Engagement & Analytical Integration

Objective: Offer users better experience, feedback, and information for decision-making via data and alerts.

Sprint	Release Cadence	User story delivered	Sprint delivered	Output
Sprint -5	Week 12 by the end of sprint 5	SAOS005	Performance Dashboards- Daily/Monthly for Orders, deliveries, Feedback, sales and payments	Performance dashboards on a daily or monthly basis reveal order, delivery, sales, and payment information. Reinforces strategic communication.

Release 4: Business Intelligence & Optimizations

Objective: Trend analysis is provided to be used for better decision-making and working

Sprint	Release Cadence	User story Delivered	Sprint Delivered	Output
Sprint -6	Week 16 by the End of Sprint 6	SAOS006	Visual trend analysis about ordered item, client, date useful for strategic decision making	Users can analyze patterns by item, client, or date. Makes it possible to plan better the forecasting, resource allocation, and avoids miscommunication.

The set of iterative release stages detailed in this project shows how the SAOS digital transformation is designed to be deployed in steps that are impactful. By following Agile, the team ensures that with every new release, the system offers new benefits such as easy ordering, billing customers and improving communication within the company.

All work focused on a sprint is tied to the business targets, making sure stakeholder feedback is added at each sprint review, demo and when the backlog is updated. Applying this way works to reduce risks, speed projects up and assure that the team deals with real-life problems at each phase.

The final launch of SAOS will see an improved online system for orders and invoices that takes care of many of their business needs, from saving time to pleasing clients and making growth easier. Since users get new features progressively, this allows them to learn easily and be well-supported.

This roadmap establishes a base for lasting success and allows SAOS to meet its present and future requirements well.

12. Acceptance Criteria

Each user story has been broken down into three key components: “Given” that we refer to the “context”, “When” works for the “action”, and “Then” referring to the “expected outcome”. This format, commonly used in Agile methodologies, is critical for writing clear and testable acceptance criteria, which define when a story is considered “done” and acceptable to the user.

These criteria were developed to address the operational issues that Stationaries and Office Supplies Inc. (SAOS) was facing due to rapid business growth and a lack of digital systems. Then format to make it easier to understand what needs to happen, when it happens, and what the result should be. This way, the team knows when a story is complete and working the way it should. We used this format to avoid confusion and to help developers and users

be on the same page during the project. Since SAOS is moving from a manual system to Salesforce CRM, these steps will help reduce errors, save time, and make the whole process more efficient and user-friendly.

By defining these acceptance criteria upfront, we ensure that each feature delivers measurable value, meets business needs, and is validated by the end user during testing phases like UAT. This table becomes a guiding tool for development and quality assurance throughout the Agile lifecycle.

User Stories Delivered	Story	Given	When	Then
SAOS001	Shop clerk enters client orders digitally.	The shop clerk is logged into the system.	They enter client and item details into the digital form.	The order is saved correctly and shows a confirmation message.
SAOS002	Delivery clerk updates delivery status online.	The delivery clerk is on the order tracking page.	They change the delivery status and add dispatch details.	The status updates in real time and becomes visible to clients and the team.
SAOS003	The manager sends automated invoices.	Orders have been marked as fulfilled in the system.	The manager reviews the auto-generated invoice on the dashboard.	The invoice is accurate and can be emailed directly to the client.
SAOS004	Accountant verifies orders and payments.	Order and payment data are available in the system.	The accountant matches payments to related orders.	Any mismatches are flagged, and accurate records are saved.
SAOS005	The manager generates business reports.	The manager accesses the report dashboard.	They choose filters for daily or monthly reports.	The system generates reports including orders, fulfillment, and payments.
SAOS006	Manager analyzes order and fulfillment trends.	The system has collected data from recent activities.	The manager applies filters to visualize trends by date, client, or item.	The insights are displayed and can be exported for review.

13. Test Criteria

For each sprint deliverable:

Within the digital transformation at Stationaries and Office Supplies Inc. (SAOS), a strong and orderly test framework has been put in place to support the use of Salesforce CRM by Agile methodology. Because more customers and orders are coming through, the retail store now needs a system that works flawlessly. This goal is achieved by dividing every user story such as digital order logging, analytics and reporting into working sprints that provide something useful.

Tests in each sprint cycle make sure new developments perform correctly, fit in well with the system and do not cause problems for earlier features. The main layers for quality in the testing framework are Unit Testing, Integration Testing, System Testing, User Acceptance Testing (UAT) and Regression Testing.

Unit Testing checks each form, all the validation rules and each calculation to see if they are working as intended.

Integration Testing examines how modules connected to each other such as order processing and invoice preparation interact.

Making System Testings involves going through the complete business process to show case usage in actual conditions.

UAT means business users use the actual system in real situations to check if it fulfills their goals and expectations.

Regression Testing helps protect the system if updates break something that worked before.

Because of this strategy, SAOS can soon deliver working software and quickly fix problems, try out different solutions and launch a system that matches the business's real requirements step by step.

Sprint	User Stories Delivered	Unit Testing	Integration Testing	System Testing	User Acceptance Testing (UAT)	Regression Testing
Sprint 1	SAOS001 – Order Logging	- Form input validation - Item & quantity selection logic - Duplicate order prevention	- Client selection and item database link - Order module to logging dashboard	- Order form submission → Entry in order system → Confirmation	- Order clerks test real-time order entry and receipt confirmation	- Ensure previous manual orders do not interfere with digital orders
Sprint 2	SAOS002 – Order Fulfillment Tracking	- Fulfillment status update logic - Dispatch method input validation	- Integration of order status with client and delivery clerk views	- Order entry → Status marked as fulfilled → Reflected in client view	- Delivery clerks and clients verify status change and transparency	- Check that digital order logging (SAOS001) still

						reflects proper status
Sprint 3	SAOS003 – Automated Invoicing	- Invoice math checks: total, tax, quantity-price match - Flagging anomalies	- Order module → Invoice generation → Manager dashboard	- Order fulfilled → Invoice generated → Sent via email	- Managers review accuracy, flagged issues, invoice formats	- Verify previous invoice records remain intact; prevent invoice duplication
Sprint 4	SAOS004 – Accounting & Reconciliation	- Payment-entry validation - Cross-verification logic between invoice and payment	- Invoice & payment record link - Reconciliation log trigger	- Invoice issued → Payment matched → Reconciliation recorded	- Accountants validate payment logs and flagging accuracy	- Ensure no mismatch from changes in prior modules (orders, invoices)
Sprint 5	SAOS005 – Report Generation	- Report field validation (date, item, value) - Export function checks	- Connection to order, invoice, and payment databases	- Full business cycle → Reporting interface → Export report	- Managers verify generation of daily/monthly reports	- Confirm reports reflect accurate data from earlier modules
Sprint 6	SAOS006 – Data Analysis	- Graph/chart rendering tests - Filter accuracy (by item/client/date)	- Integration of all modules' data into analytics view	- Fulfillment/invoice/report data → Analytics dashboard	- Managers validate trend reports and filters	- Ensure analytics work off consistent and accurate data history

The use of this structured approach in testing makes certain that any new feature introduced during a sprint meets the necessary requirements and is also stable, connected and fits the expectations of the end users. When testing is done in layers—unit, integration, system, UAT and regression—the project saves from defects, makes users feel confident and helps the project go smoothly from manual to digital. Performing User Acceptance Testing at the close of every sprint allows clerks, managers and accountants to suggest updates, so developers can make the most significant changes and fix issues that are most important. Regression testing adds to the cycle by verifying that updates do not damage the logic or performance of the business system. Following this strong and detailed testing process plays a major role in the success of the SAOS Salesforce CRM implementation. CICD enables the Agile principles by iteratively producing deliverables, checking work early and often and always looking to get better. Therefore, SAOS is focusing on both automation and

creating a resilient system that keeps users in mind, allowing the business to adapt as growth continues and maintain value for all their departments and stakeholders.

14. Definition of Ready

Overview of DoR and its significance:

In Agile projects, the **Definition of Ready (DoR)** is a set of criteria that determine whether a user story is sufficiently prepared to enter a development sprint. The DoR acts as a “checklist,” ensuring that each Product Backlog item (PBI) has all the information the team needs before work begins. While the Scrum Guide (2020) does not explicitly mandate a DoR, it does state that Product Backlog items which “can be Done by the Scrum Team within one sprint are deemed ready” for selection in sprint planning. This implies that a well-refined user story – one that is small enough and clearly defined – is considered “ready” to be pulled into a sprint.

DoRs are not necessary in Scrum, but many teams recognize their great value in improving how they organize and work on sprints. This process makes sure everyone on the team is aware of everything they need to accomplish, which minimizes errors and unnecessary distractions throughout the sprint. The Scaled Agile Framework (SAFe) similarly emphasizes using a DoR at multiple levels; it is an agreement among teams that a work item is fully understood and ready to start, helping to avoid misalignment or wasted effort. For Stationaries and Office Supplies Inc. (SAOS), which is transitioning from manual processes to a computerized system, having a robust DoR is critical. It guarantees that each user story (SAOS001 to SAOS008) is immediately actionable by the developers, thereby setting the project up for successful, smooth sprints even as the company adopts Agile methodology.

Criteria for a ‘Ready’ User Story:

The following bullet-point criteria define when a SAOS user story is considered “ready” to be pulled into a sprint. These criteria are grounded in Agile best practices and ensure that any user story selected for development is fully presented and understood:

- **Clear and Well-Understood:** The user story is written in a clear, concise manner, and its purpose is understood by the whole team. This means the story follows the standard format (“As a (user)... I want... so that...”) with no ambiguities in scope or intent.
- **Acceptance Criteria Defined:** The story includes specific, testable acceptance criteria that describe conditions of satisfaction. These criteria serve as tests for confirming the story’s completion and ensuring the team understands the conditions.

- **Sized Appropriately (Small & Estimable):** The user story is small enough to be completed within one sprint and has been estimated by the team. A story that is too large or vague must be broken down during backlog refinement so that it can be finished in a single iteration.
- **Dependencies Resolved:** All dependencies related to the story are identified and addressed before the story enters the sprint. This includes any external systems, sub-components, or other user stories that this story relies on. The story should not be blocked waiting for another task.
- **Team Consensus and Understanding:** The development team has discussed the story (typically during backlog refinement) and agrees it is ready to work on. All team members share a common understanding of what needs to be done and how to demonstrate it is done. In other words, the team can determine the tasks to implement the story and is aware of the acceptance tests that will confirm the story's completion.
- **Product Owner Approval & Value Confirmation:** The product owner has agreed that the story is important, offers business value, and should be a top priority in the following sprint. Requirements for the story need to suit the objectives, and the story's content should be accepted by stakeholders if this is a requirement.

All these checkboxes make it possible to move user stories into a sprint with little concern about any risks. If the SAOS team follows a strict DoR, everyone can be sure that the selected stories are clear, feasible, and agreed upon, so planning and reaching deliverables become simpler. This practice upholds Agile principles by promoting transparency and shared understanding, which in turn leads to more predictable and high-quality sprint outcomes.

Summary of Readiness for SAOS User Stories:

User Story ID	Intent Summary	Meets DoR?	Reason
SAOS001	Digital order entry by shop clerk	Yes ☐	Clear goal, no dependencies, estimated, approved
SAOS002	Real-time delivery status updates by delivery clerk	Yes ☐	Depends on SAOS001(now completed), reviewed, and sized
SAOS003	Automated invoicing for manager	Yes ☐	Dependences (SAOS001 & 002) resolved, estimated and detailed
SAOS004	Reconciliation of payments by accountant	Yes ☐	Dependent stories are done, acceptance criteria defined
SAOS005	Performance reporting via automated dashboards	Yes ☐	All dependencies finished, testable scope outlined
SAOS006	Manager data analysis and trend review	Yes ☐	Last in sequence, dependent stories complete, analysis criteria defined

15. Definition of *Done (D.O.D)*

A definition of done is a set of criteria that a product increment must meet for the team to consider it complete and ready for customer usage. For successful integration of the Salesforce Software, a set of criteria has been developed by the entire project team and has been agreed on as a defined standard for “Done” on the project. This was based on a shared understanding of the project team, including product owners, testers and other stakeholders. For the software integration, our definition of done included;

- Code written, peer-reviewed and committed
- Unit and Integration Test passed
- Stakeholder Review completed
- Documentation and User Updated
- Product increment has been deployed to staging environment, ready for production
- Formal signoffs
- Lesson learned documentation and archiving

Feature Area	Code Written, Peer-Reviewed, and Committed	Unit and Integration Test Passed	Meets all Acceptance Criteria	Stakeholder Review (UAT) Complete	Documentation and User Guide Updated	Deployed to Staging, Ready for Production	Formal Signoff	Lessons Learned
Order Logging	✓	✓	✓	✓ (Done by Order Clerk, Product Owner & Manager)	✓	✓	✓	✓
Order Fulfillment	✓	✓	✓	✓ (Done by Order	✓	✓	✓	✓

				Clerk, Delivery Clerk, Product Owner & Manager)				
Customer Invoicing	✓	✓	✓	✓ (Done by Shop Clerk, Product Owner & Manager)	✓	✓	✓	✓
Accounting and Reconciliation	✓	✓	✓	✓ (Done by Audit Team)	✓	✓	✓	✓
Report Generation	✓	✓	✓	✓ (Done by Manager)	✓	✓	✓	✓
Report Generation	✓	✓	✓	✓ (Done by Manager)	✓	✓	✓	✓
Data Analysis	✓	✓	✓	✓ (Done by Manager)	✓	✓	✓	✓

16. Conclusion

The transformation project at Stationaries and Office Supplies Inc. (SAOS) represents a giant step from a disconnected manual system to a unified, flexible, and automated digital solution, which was made possible by the Salesforce CRM system. Due to operational bottlenecks caused by business growth, SAOS has opted to adopt Agile practices in a strategic way to ensure timely delivery, continuous feedback, and progressive system improvement.

This initiative has six targeted operational functions, such as order logging, order fulfillment, customer invoicing, accounting, reporting, and data analytics, to fulfill business needs into clear user stories with acceptance criteria. Each functionality was delivered through structured sprints and bundled into four strategic releases, which not only helped in solving the issues of high priority at the earliest but also brought about user participation.

Strong quality assurance was the foundation at every level, which included unit testing, integration testing, UAT, and regression testing; thus, risk was kept to a minimum and delivery was stable. The adherence to Agile principles, like the definition of ready, definition of done, and backlog refinement, among others, has further helped project execution to become even more solid.

Consequently, SAOS is now able to have a scalable, cloud-based CRM system that:

- Makes critical workflows go on automatically,
- Improves customer experience,
- Lessens human errors and managerial workload,
- Enables data-driven decision-making,
- And is compatible with future expansion.

This digital transformation initiative is not just meeting the operational goals of today but is also setting SAOS on a pathway to sustainable success in a competitive, client-driven marketplace.
